

GitHub Copilot Training Assignment

DRINKOO RAG Chatbot Capstone

CloudThat | Client: Tredence | Faculty: Ankit Jha | Subject: Copilot Training

Repository

<https://github.com/ankitjh4/assignment>

Goal

Build a working Python-centric DRINKOO website with a grounded RAG chatbot and strong Text2SQL behavior.

What Learners Build

- FastAPI backend with clean routes and configuration.
- Simple HTML/CSS/JS frontend with login, chat, upload, and status views.
- SQL database with six or more useful DRINKOO tables.
- RAG chatbot grounded in the dummy company dataset.
- Image upload, authentication, authorization, tests, and reports.

How The LLM Layer Works

- Use OpenRouter with the learner's own API key and a free model.
- Never submit or commit the API key.
- Save the final model name and prompt in prompt.md.
- Prompt quality is graded for grounding, refusal behavior, clarity, and useful answers.

Evaluation Scorecard

20

Database schema, saved SQL, and Text2SQL correctness

20

RAG quality, grounding, and OpenRouter prompt quality

15

Working Python/FastAPI backend and code quality

15

Frontend usability and presentation

10

Authentication, authorization, and image upload

10

Tests and working application evidence

5

Lightweight ADLC, UAT protection, and Copilot workflow evidence

5

Security, status page, and basic observability

How It Will Be Reviewed

Submissions are checked against the scorecard above. The automated repository check catches missing artifacts; human review confirms whether the website actually works, answers are grounded, SQL is correct, and the UI is usable.

Learner Reminder

Read README.md, plan.md, prompt.md, ADLC files, and every folder todo.txt before coding.
The GitHub Copilot MCQ assessment will be shared separately by the faculty.
